River Corridor Protection Area
ANR River Corridor - January 2015

Digital Flood Insurance Rate Map

Special Flood Hazard Area (100 Year Floodplain)
View individual Municipal Regs for detail

DATA SOURCES:
Dams data from US Army Corps of Engineers; Insufficient structures derived from ANR geomorphology inventories. River Corridor Protection Area equals a river's meander belt (also known as Fluvial Erosion Hazard Area). River Corridor equals a river's meander belt plus buffer extension. See Floodready.vermont.gov for more detail. FEMA DFIRM - developed in 2011 by FEMA consultant. Municipal Water Protection Buffers & Setbacks derived from municipal zoning regulations.

* Mostly incompatible 5<GC<10
** Fully incompatible 0<GC<5

Legend:
- Mostly Incompatible: Structure mostly incompatible with current form and processes, with a moderate to high risk of structure failure. Re-design and replacement planning should be initiated to improve geomorphic compatibility.
- Fully Incompatible: Structure fully incompatible with channel and at high risk of failure. Re-design and replacement should be performed as soon as possible to improve geomorphic compatibility.

FEMA Public Assistance Projects
2017
Shelburne, Vermont
All-Hazards Mitigation Plan

Public Assistance Category
- Debris Removal
- Protective Measures
- Roads & Bridges
- Water Control Facilities (Stormwater Management)
- Public Buildings
- Public Utilities
- Recreational or Other

Note: Some Debris removal and protective measures locations are shown at the location of the municipal office. This indicates assistance was at various locations throughout the municipality not that damages were incurred at the office.

Vulnerable Populations

Shelburne, Vermont
2017 All-Hazards Mitigation Plan

Note: The Social Vulnerability Index (SVI) draws together 16 different measures of vulnerability in three different themes: socioeconomic, demographic, and housing/transportation. The 16 individual measures include poverty, unemployment, per capita income, educational attainment, health insurance, children/elderly, single parent households, disability, minority, limited English, location of apartment buildings, mobile homes, crowding, no vehicle access, and population living in group quarters. The measures are combined to create relative vulnerability index. For every vulnerability measure, census tracts above the 90th percentile, or the most vulnerable 10%, are assigned a flag. The vulnerability index is created by counting the total number of flags in each census tract. It is important to remember that this Social Vulnerability Index is just a first step in screening for populations that may be more or less vulnerable to a variety of hazard. Depending on the situation, different measures could be more or less important and should be looked at more closely. These data are NOT saying that one census tract is more vulnerable than another. Rather it is saying that there is a higher concentration of various vulnerable population living within a tract and seeks to identify the conditions that make a population vulnerable.

**Westford, Underhill, and Bolton are contained within one census tract. St George and Hinesburg share the same census tract boundary. Huntington and Buels Gore also consist of one tract. All the other municipalities are broken down by one or more tracts. More urban communities have many more tracts as the optimal population for tract is 4,000 people. The minimum population threshold is 1,200 and the maximum is 8,000.**
