In accordance with provisions of the Americans with Disabilities Act (ADA) of 1990, the CCRPC will ensure public meeting sites are accessible to all people. Requests for free interpretive or translation services, assistive devices, or other requested accommodations, should be made to Emma Vaughn, CCRPC Title VI Coordinator, at 802-846-4490 ext *21 or evaughn@ccrpcvt.org, no later than 3 business days prior to the meeting for which services are requested.

CCRPC Long Range Planning Committee

AGENDA

DATE: Thursday, April 13, 2017
TIME: 8:30am to 10:00am
PLACE: CCRPC Office, 110 West Canal Street, Suite 202, Winooski, VT.

1. Welcome – 5 minutes

2. Approval of March 9, 2017 Minutes* (Action) - 5 minutes

3. Energy Planning* (Discussion) – 40 minutes
   a. Regarding wind and solar generation, the current versions of the Act 174 maps are attached (solar potential and wind potential). We’ve also attached the solar data analysis and targets. Please note that the maps and the spreadsheet accounts for the local known constraints, but not the local potential constraints yet. We will also discuss a change in guidance on planning for wind generation.
   b. Revisions to the energy elements of the ECOS Plan to start the discussion on the Plan language.

4. Transportation (Discussion) – 30 minutes
   Staff will present an overview of how the model works; and we’ll review and ask for your feedback on the scenarios (see the attached memo).

5. Comprehensive Economic Development Project List* (Discussion) – 10 minutes
   The LRPC’s comments on the project list that were received via email have been incorporated into the attached list; and I’ve made the changes that appear to have consensus. Generally, we seem on board with keeping airport projects, keeping road/redevelopment projects that are regional in nature, and there are some questions on CWD and CSWD projects. We’ll ask for confirmation on the types of projects and get these out to the municipalities for updates, additions and deletions.

6. Next Meeting
   Thursday, May 11, 2017 from 8:30am to 10:00am

7. Adjourn
   *=attached to agenda in the meeting packet

In accordance with provisions of the Americans with Disabilities Act (ADA) of 1990, the CCRPC will ensure public meeting sites are accessible to all people. Requests for free interpretive or translation services, assistive devices, or other requested accommodations, should be made to Emma Vaughn, CCRPC Title VI Coordinator, at 802-846-4490 ext *21 or evaughn@ccrpcvt.org, no later than 3 business days prior to the meeting for which services are requested.
DATE: Thursday, March 9, 2017
TIME: 8:30 a.m. to 10:00 a.m.
PLACE: CCRPC Offices, 110 West Canal Street, Suite 202, Winooski, VT

Members Present
Ken Belliveau, Williston – PAC Rep
Alex Weinhagen, Hinesburg – PAC Rep
Edmund Booth – ECOS Steering Committee Rep
Chris Shaw, South Burlington – Board Rep
Heather Danis – ECOS Steering Committee Rep
(via phone)
Jim Donovan – Board Rep

Staff
Regina Mahony, Planning Program Manager
Melanie Needle, Senior Planner
Eleni Churchill, Transportation Program Manager
Christine Forde, Senior Transportation Planner
Peter Keating, Senior Transportation Planner

1. Welcome and Introductions
Chris Shaw called the meeting to order at 8:35 a.m.

2. Approve Minutes
Ken Belliveau made a motion, seconded by Alex Weinhagen, to approve the minutes of February 9, 2017. No further discussion. MOTION PASSED. Jim Donovan abstained.

3. Forecasts
Melanie Needle indicated that we just received the revised forecast yesterday, and presented it to the PAC yesterday afternoon. Melanie Needle provided some highlights from the revised forecast, taken from the EPR memo (to be clear the changes as described below are from the previous forecast and the revised forecast):

- With these population and employment forecasts, Chittenden County is expected to be the leader in Northwest Vermont and the State of Vermont in population and employment growth.
- Keep in mind: High confidence in the county forecasts, significant degree of error in the municipal forecasts given the level of granularity although have taken into account the town perspective and statistical reliability.
- Population
  - The 2010 and 2015 population estimates correspond to the U.S. Census estimate and not the adjusted estimates.
  - Normalized population growth in Bolton, Charlotte, Colchester, Hinesburg, Jericho, Richmond, St. George, and Underhill resulted in a decline, except Charlotte remained steady
  - Burlington, South Burlington, Williston, Shelburne, Essex, and Milton received residual population. This reallocation accounted for some of the scale issues that we faced in the initial forecast, namely that Williston was increasing at levels that might have been unrealistic especially when compared to other areas like Burlington and South Burlington
- Households
  - Change in households in Burlington, to reconsider given the residential development plans
  - Household levels remain fixed for most of the municipalities in the revised forecast but allow the population living in households fluctuate
- Employment
  - In the initial forecast, Essex’s share of employment was decreasing and not consistent with a recent GBIC study - we fixed the share of Essex’s employment at its 2015 level through 2050. This resulted in an increase of nearly 13,000 jobs from 2015 through 2050 for Essex when compared to the initial forecast.
Bolton, Charlotte, Colchester, Milton, Richmond, St. George, Underhill, Westford, and Williston decreased; Burlington, Colchester, Milton, South Burlington, and Williston increased; Hinesburg, Huntington, Jericho, and Winooski, remained steady.

There was further discussion regarding the household size and confusion over a chart presented by EPR that appears to show that ‘Persons in Households’ would increase, and quite drastically from 2040 to 2050. Staff will get clarification on this. The PAC voted to recommend that the Board adopt the forecast, with clarification on the household size; however, Colchester voted against the motion.

Peter Keating asked if the GBIC study covered more municipalities than Essex and Essex Junction. Melanie Needle indicated that it does include more. There was some discussion over the bullets in the slides as some municipalities are shown as both ‘decreased’ and ‘increased’. It was clarified that the memo does indeed describe the changes both ways, and it is possible do to the re-distribution. Ken Belliveau stated the numbers in the short run for Williston are going to be off, the long-run they may be right. But I bet the 2020 number is going to be off. The population over the last 5 years went up by 700 people, and they show an increase of only 300+. Ken Belliveau added that they say about 100 new households in 2016. Ken Belliveau further explained Williston’s growth management policy – they have a cap of 80 dwelling units per year cap on wastewater allocation; and those allocations are good for 5 years. So 80 is not necessarily a cap on the actual number of housing units built per year. Alex Weinlagen referred to the household size spreadsheet for the revised forecast; and asked specifically about Burlington. The developments Burlington is seeing are not likely to produce an increase in household size. There was some discussion about the top down methodology (state to county to municipality) being a potential reason for this. EPR has been very clear about their lower level of confidence on the municipal forecasts.

Jim Donovan made a motion, seconded by Ken Belliveau, to recommend that the CCRPC Board approve this forecast, with a clarification on the number of persons in household. No further discussion. MOTION PASSED.

4. Transportation Schedule, Initial Project List and Fiscal Constraint

Eleni Churchill gave an overview of the MTP update schedule. Jim Donovan asked about returning back to the project list, once we run the model. Eleni Churchill and Christine Forde stated that we will do that. It is a two phase process – we include committed projects in the model to start, then the model will inform us of areas where other projects may be needed, and so we will go back and revise the list accordingly.

Christine Forde described the project list and explained that it is currently prioritized based on the methodology we’ve been using for a number of years. We will still need to add the fiscal constraint figure to the list. The list may not be complete. Christine Forde has reached out to the Towns with yellow highlighted projects on the roadway list.

Chris Shaw asked about the money – do we have separate pots of money for the roadway projects and the bike/ped projects? The fiscal constraint (total amount of dollars we can expect over the life of the plan) is one total number. In the current ECOS Plan, we made some decisions based on ECOS goals about what amount of money went into each funding category. There was a question about the accuracy of the construction cost estimates, and whether they will be increased to FY16 dollars. Peter Keating stated that we should and will do that, as some of these figures might be quite out of date and therefore not a true enough reflection of the real costs.

Peter Keating described the fiscal constraint process. In planning the last MTP we used 17% of the State’s pot of federal funding as our estimated share. That was the historic average over the previous seven years. It looks like the federal funding looking out into the future will remain flat. But we are meeting with VTrans to talk about Chittenden County’s share of the funding. In the last five years it has only been about 13%, but if you look back over 20 years it was closer to 20%. Once we know the final fiscal constraint figure, we will
break it down into the categories. Christine Forde added that the County has never had a consistent share of the state’s federal funding because it is depends on the projects in the pipeline.

5. Energy Planning Maps and Data Analysis
Melanie Needle described the methodology for identifying the wind and solar goals.

Ken Belliveau stated that we don’t want to make this completely additive. If acreage is going to be used for a solar array, it will likely take it out of the running for wind.

Chris Shaw asked if Staff has asked the municipalities for their input on siting location. Yes, we have. Chris Shaw also asked if the region and the municipalities have to meet the targets. Melanie Needle explained that this is not a requirement. Regina Mahony added if the municipalities want the elevated level of input in the PSB process then they have to show how they are meeting the state energy goals and these targets.

Alex Weinhagen asked about incorporation of the local constraints in the targets before the low and high range targets are calculated. Melanie Needle stated that the overall goal should be equal at the start. Alex Weinhagen asked if the municipal level 2 constraints (agricultural soils as an example), are being calculated into the targets? Those are real constraints also (in addition to the complete ‘no gos’) so they should be subtracted from the usable acreage. In addition, Alex Weinhagen stated that not all ‘prime’ acreage is going to actually be developed 100% with solar. We should add a qualifier that takes this into account.

There was a discussion regarding state highway ROWs, and whether they are listed as a constraint or not. Melanie Needle brought up the most recent guidelines and state highway ROWs are not included on the constraints list. Ken Belliveau stated that we aren’t even allowed to put a bike path in the CIRC ROW, so it shouldn’t be in the calculations for solar or wind.

There was a discussion about how and when we will account for roof-top solar. Melanie Needle described how Bennington accounted for it (they assumed a 50% reduction for the amount of rooftops that could be eligible for solar). That seems high, and the LRPC asked Staff to see if we could get a more accurate ‘solar capable’ rate from the solar companies. Alex Weinhagen also asked if we could do a rooftop capability GIS exercise since we have the footprint data. Staff will look into this.

Regina Mahony briefly went over the project list that was in the packet. Regina Mahony will follow-up via email with the list and a rationale for why we are suggesting things for removal. Jim Donovan suggested there may be some projects that are more regional and maybe should stay. Jim Donovan will share his thoughts with the LRPC via email.

7. Next Meeting
April 13, 2017 from 8:30am to 10:00am

10. Adjourn
The meeting adjourned at 10:05 a.m.

Respectfully submitted, Regina Mahony
Potential Solar Energy Resource Areas

Bolton, Vermont
Act 174
The Energy Development Improvement Act of 2016

Local Possible Constraints to be added which may turn prime areas to base areas.

This map and the corresponding data is intended to be used to inform energy planning efforts by municipalities and regions. The map may also be used for conceptual planning or initial site identification by those interested in developing renewable energy infrastructure. They should NOT take the place of site-specific investigation for a proposed facility and should not be used as "siting maps."

Potential Wind Energy Resource Areas

Bolton, Vermont
Act 174
The Energy Development Improvement Act of 2016

This map and the corresponding data is intended to be used to inform energy planning efforts by municipalities and regions. The may also be used for conceptual planning or initial site identification by those interested in developing renewable energy infrastructure. They should NOT take the place of site-specific investigation for a proposed facility and should not be used of as "siting maps".

*Note: Local Known Constraints for Bolton, Colchester, Town of Essex, Hardwick, Jericho, Milton, South Burlington, Underhill, and Westford have been mapped. Burlington and Charlotte are pending. The other remaining identified known local constraints.

Sources:
Solar Energy Resource Areas; VCGI, 2017

Disclaimer:
The accuracy of information presented is determined by its sources. Errors and omissions may exist. The Chittenden County Regional Planning Commission is not responsible for these. Questions of on-the-ground location can be resolved by site inspections and/or surveys by registered surveyor. This map is not sufficient for delineation of features on-the-ground. This map identifies the presence of features, and may indicate relationships between features, but is not a replacement for surveyed information or engineering studies.
Potential Wind Energy Resource Areas
Buels Gore, Vermont
Act 174
The Energy Development Improvement Act of 2016

This map and the corresponding data is intended to be used to inform energy planning efforts by municipalities and regions. The map may also be used for conceptual planning or initial site identification by those interested in developing renewable energy infrastructure. They should NOT be used as "siting maps".

Local Possible Constraints to be added which may turn prime areas to base areas

*Note: Local Known Constraints for Bolton, Colchester, Town of Essex, Hinesburg, Jericho, Milton, South Burlington, Underhill, and Westford have been mapped. Burlington and Charlotte are pending. The other remaining towns have not identified known local constraints.

2.2.3 CLIMATE CHANGE

Climate Change Goal: Reduce greenhouse gas emissions contributing to climate change and adapt to become more resilient to a changing climate.

Key Issues/Trends/Insights
[Data for this section drawn from Chittenden County Climate Change Trends and Impacts. Another reference that is currently under development is the Chittenden County Regional Climate Action Plan.]

- Temperature and precipitation records for the latter half of the 20th century show that Chittenden County’s climate has changed: winters became warmer and summers became hotter. Lake Champlain freezes over later and less frequently and the growing season lasts longer. Annual precipitation has increased, but more falls as rain instead of snow.
- Scientists overwhelmingly agree that changes in climate worldwide are a result of human activities, mainly the burning of fossil fuels. Climate model forecasts for the Northeast US predict that during this century temperatures will continue to increase, as will extreme heat days and heat waves. More precipitation and extreme precipitation events are expected to increase, although short-term summer droughts may also become more frequent.
- These current and predicted changes in climate have broad implications for our region.
  - Environmental Quality - Summer air quality will deteriorate, as warmer temperatures promote the formation of smog. More intense rainfall will increase storm water runoff and the potential for flooding. Increased rain and runoff will wash pollutants into our waterways, and warmer waters and nutrients will encourage growth of bacteria and blue-green algae.
  - Natural Communities - Cold-water aquatic species, such as brook trout, will struggle to survive in warmer waters and in competition with better-adapted species. Our forests will change: maple, beech and birch trees will gradually be replaced by oak and hickory trees that are better adapted to warmer, wetter conditions. Invasive species, like the hemlock wooly adelgid, will further affect change in forest composition.
  - Public Health - Warmer temperatures allow the spread of insect-borne diseases, such as West Nile virus and Lyme disease. Air pollution and higher pollen production will increase problems for people with allergies, chronic respiratory diseases and asthma. High temperatures and heat waves will increase the risk of heat stress for the elderly, very young children and other vulnerable populations.
  - Built Environment – Flooding will put homes, businesses and public infrastructure in flood-prone areas at risk. Flooding may impact the safety of the water supply; droughts will also threaten water supplies. Although warmer winters will require less fuel for heating, hotter summers will increase electricity demands for cooling.
  - Local Economy - Warmer temperatures will hurt maple sugar production. Farmers can expect declining yields for cool-weather crops and depressed milk production from heat-stressed dairy cows. Less-colorful foliage seasons will hurt fall tourism. Less predictable snow will jeopardize winter sports and recreation and compromise Vermont’s image as a winter sports destination.

- We can respond to climate change in two different ways.
  - Climate mitigation strategies will reduce the region’s contribution of greenhouse gases. Although Chittenden County may be a small part of global greenhouse gas emissions, it is important that Chittenden County do its part to help solve the problem. More specifically Chittenden County should do what we can to help the State reach the goals of reducing 50% of greenhouse gas emissions from the 1990 baseline by 2028 and 75% of greenhouse gas emissions from the 1990 baseline by 2050.
Climate adaptation strategies help individuals, businesses and communities be able to withstand and bounce back from – or even take advantage of – the impacts of climate change.

Key Indicators

- **Greenhouse Gas Emissions** — Vermont’s goal is to reduce 50% of greenhouse gas emissions from the 1990 baseline by 2028 and 75% of greenhouse gas emissions from the 1990 baseline by 2050. In 2010, Chittenden County emitted approximately 1,193,000 metric tons of carbon dioxide equivalents (MTCO2e).

Source: Draft 2010 Chittenden County Greenhouse Gas Emissions Inventory Data rounded to three significant figures.
2.5.3 TRANSPORTATION

Transportation Goal: Provide accessible, safe, efficient, interconnected, secure, equitable and sustainable mobility choices for our region’s businesses, residents and visitors.

Key Issues/Trends/Insights
[Data for this section drawn from Historic Development and Future Land Use/Transportation Analysis Report and MTP Supplemental Documents in Chapter 4]

- Congestion is worsening with potential negative consequences on economic development, the environment and human health.
- The 2008-2009 Scenario Planning Process undertaken by the Chittenden County Metropolitan Planning Organization resulted in a clear surveyed preference for future growth to be concentrated into higher density, mixed use centers – this preference is also demonstrated in the policy direction outlined in municipal plans and ordinances throughout the County. Directing transportation investments to serve mobility and accessibility in compact settlements will result in a more cost effective and efficient transportation system.
- Continued low-density development in rural areas will increase Vehicle Miles Traveled (VMT) and likely increase potentially harmful air pollutants and greenhouse gases.
- Higher fuel prices will lead to an increase in the percentage of household income needed to meet transportation expenses; rural residents are disproportionately impacted by household transportation costs.
- Some population segments – youth, the elderly, low-income and communities of color – lack access to viable public and private transportation options. The lack of safe, reliable, and complete connections within the transportation system and between transport modes reduces access to employment, social, economic, and recreation opportunities; and limits access to basic needs by means other than a personal vehicle.
- More robust investment in transportation options – transit, walking/biking, carsharing and ridesharing – could reduce transportation energy use, congestion, vehicle miles traveled, use of single occupancy vehicles, social exclusion, and could improve public health, and enhance the economic well-being of our residents, businesses and visitors.
- While access to public transit is widely available in the region’s more urbanized areas, there are days and times when service is not available; some suburban and most rural populations lack access to transit.
- Roadway condition of over half of the arterial highway mileage in Chittenden County is rated poor or worse. Compounding our poor roadway conditions and inadequate investment, transportation funding in general is overly reliant on the state and federal gas taxes which are decreasing in value as inflation lowers purchasing power and revenues decline due to improving vehicle fuel efficiency and fewer VMT.
- Transportation costs exceed our capacity to maintain, operate, and improve our current system. Nor do we have adequate funds needed to grow transit, walking/biking, and Transportation Demand Management (TDM) programs. The prospect of less funding in a time of increasing transportation investment need is a worrisome trend and needs to be addressed.
- The MTP must be fiscally constrained to the funding anticipated for investment in the planning horizon through 2035. The following chart outlines the funds anticipated to be available for the next 25 years. The chart highlights the fact that we will not be able to afford everything that may be needed and that investments will need to be selected which promote future sustainability.
Estimated Transportation Funding for Chittenden County: 2010 - 2035

</tbody>
</table>

While our rate of driving alone to work increased by 36% between 1980 and 2000 (to 76% of all work trips), in more recent years this trend has shown improvement to 71% in 2010. We’ve also seen a nearly 60% increase in transit ridership the past decade. Vehicle Miles of Travel (VMT) per person is also on the decline, down 8% between 2000 and 2010. It is imperative that we maintain these positive recent trends in order to reduce congestion, reduce transportation energy use, decrease greenhouse gas emissions, and more efficiently utilize all of our transportation resources.

Note: Aviation transportation is planned for by the Burlington International Airport (BIA) according to Federal Aviation Administration procedures. Air to ground transportation planning is coordinated between CCRPC, BIA, and the City of South Burlington and is considered in this Plan.

The State of Vermont has a goal of obtaining 90% of energy across all sectors from renewable sources by 2050. This includes energy used for transportation. A key strategy for meeting this goal is shifting the transportation system from gas and diesel powered vehicles to electric vehicles.

Key Indicators

- **Percent of workers commuting by non-Single Occupant Vehicle (SOV) mode** (walk, bike, transit, carpool, telecommute). Recent data suggests the reversal of a negative trend going back at least 30 years and probably longer.
- **Number of electric vehicles registered.** Increasing the number of electric vehicles is key to reducing the use of fossil fuels for transportation and to reducing transportation energy use. There were 542 electric vehicles registered in Chittenden County in January 2017, or ##% of all vehicles.
2.5.5 ENERGY

Energy Goal: Reduce Chittenden County's consumption of energy across all sectors (heating, electricity and transportation) by 15% by 2025, and by more than 1/3 by 2050, and reliance on non-renewable, energy. Obtain 90% of the County's energy from renewable sources by 2050. Improve the cost-effectiveness, efficiency and reliability of the energy production, transmission, and distribution system.

Key Issues/Trends/Insights

[Data for this section drawn from: Energy Analysis Report and Climate Change Trends and Impacts Report].

Transition to Renewable Energy

- The State of Vermont has established goals of obtaining 90% of energy across all sectors (heating, electricity and transportation) by 2050, using more than 1/3 less energy by 2050, and weatherizing 25% of homes by 2020. A significant shift in behavior and energy generation sources will be necessary to meet these goals.

- Chittenden County citizens, businesses, and industries spent about $617 million on energy in 2009 (25% of Vermont's total). Much of this money leaves the County and state immediately. This outflow of energy dollars acts as a drain on the local economy (data need to be updated).

- The price of energy is forecasted to continue increasing in the future, which will result in an additional burden on the County's residents and businesses, unless energy consumption can be reduced (needs to be updated—is this still true?).

- Fossil fuel combustion increases the atmospheric concentration of carbon dioxide and other greenhouse gases, which are the causes of global climate change. Climate change will have profound impacts on the environment, public health, infrastructure, and economy of Chittenden County.

- Vermont, and the County, relies heavily on fuel oil for building heat and on gasoline and diesel for transportation. Gasoline consumption has increased as more residents drive to and from work, run errands, and consume for goods.

- The more widespread adoption of electric vehicles should reduce the total energy consumption in the County, due to better efficiency (an EV gets the equivalent of 100 miles/gallon). To prepare for widespread adoption of electric vehicles, charging infrastructure should be developed. In addition, policies and pricing structures to encourage off peak charging need to be considered to mitigate grid constraints.

- Chittenden County is home to an international airport and a National Guard base, therefore the transportation fuel consumption in the County not only includes gasoline, diesel, and compressed natural gas, but also aviation gasoline and jet fuel. Fuels used by airplanes are unlikely to have renewable alternatives. The remaining 10% of energy left out of the 90% renewable by 2050 goal takes this into account.

- Though the State has set a goal for obtaining 90% of energy across all sectors from renewable sources by 2050, we must recognize that natural gas serves much of Chittenden County, has recently expanded its service area, and is a cheap fuel source. Therefore, meeting the 90% by 2050 goal will be a challenge, especially in the heating sector.

- In 2016, the Vermont Legislature enacted Act 174 to increase energy planning and give towns and regions the ability to seek "substantial deference" for their land use policies, a policy change
Electric Efficiency

- Chittenden County has a long history of electrical and natural gas energy efficiency programs, dating back to 1990, which have provided significant energy savings and economic benefits to the state and County. These programs along with improvements in federal standards have led to a reduction in per household and per employee energy consumption of electricity and natural gas. Reduction in energy consumption directly results in a reduction in energy bills. See Indicators for data on efficiency gains.

- Electric efficiency programs have always worked to reduce electrical demand especially during peak periods but the development of the Smart Grid will provide a powerful tool to address this issue. Smart Grid coupled with education, behavior change, and load control technologies can help reduce peak demand and defer substation upgrades which can result in substantial cost saving.

- While efficiency programs targeting electricity and natural gas have been largely successful, there is an urgent need to fund and develop similar programs for non-regulated thermal fuels and for the transporation sector. The more widespread adoption of electric vehicles should reduce the total energy consumption in the County, due to better efficiency (an EV gets the equivalent of 100 miles/gallon). To prepare for widespread adoption of electric vehicles, charging infrastructure should be developed. In addition, policies and pricing structures to encourage off peak charging need to be considered to mitigate grid constraints.

- It is necessary to shift the heating sector away from fossil fuel use. Promoting cold climate heat pumps, in addition to wood, biogas and geothermal heating systems, will be key to meeting this goal.

- There is a need for focused study to determine solutions for vermiculite removal as it relates to weatherization, in particular low income weatherization. Vermiculite was used as an insulator for decades (1960-1990) – and was mined with asbestos thus any home with vermiculite is assumed to be contaminated.

Renewable Energy Generation

- Chittenden County has many non-fossil fuel based, renewable energy production sites owned by utilities, private parties, and municipalities. Reliable, cost effective, and environmentally sustainable energy availability is critical to support the economy and natural resources of Chittenden County.

- Vermont’s rural nature offers challenges for the transmission and distribution of energy. It is important to maintain and develop an energy production, transmission, and distribution infrastructure in Chittenden County that is efficient, reliable, cost-effective, and environmentally responsible. Current energy distribution projects include: Extension of 3-phase power in south Hinesburg along VT116 by Green Mountain Power; Extension of natural gas service in Hinesburg up Richmond Road by VT Gas; and Extension of natural gas service to St. George village center. In addition, Burlington’s plan to recapture “waste heat” from the McNeil power plant and distribute it to the Old North End of Burlington and heat greenhouses at the Intervale is a thermal energy project with a more efficient distribution of a previously wasted energy source. See the CEDS Project list in Section 4.2.6 for cost estimates, funding sources and proposed timelines for these projects. (This will be updated to reflect the completion of some projects)
The cost of electricity is related to the distance it travels. When electricity is transmitted over long distances, a significant amount of electricity is lost. Improving line efficiency or encouraging distributed generation (such as locally sited small scale renewable projects) reduces losses and could result in more cost effective rates.

Every three years, Vermont Systems Planning Committee (VSPC) launches a process to update and identify constrained areas and reliability needs for the electric transmission grid. Chittenden County has areas identified as needing improvement. An adequate distribution grid that is able to accommodate the planned increase in electricity use and reduces energy loss is necessary to meet the goals of this section.

- CCRPC has undergone a process to look at solar and wind generation sites to determine our ability to meet the 90% renewable by 2050 goal. See the key indicators below for an analysis of existing generation and future generation possibilities.

Key Indicators (This section will be updated with data provided by LEAP and will allow this plan to meet the Act 174 Target and Analysis Standards)

- **Current energy Consumption in the Transportation Sector, and 2025, 2035 and 2050 targets for consumption.** The graph below shows current energy consumption across all sectors and sets targets for future consumption in line with the goals of a greater than 1/3 reduction by 2050.

- **Current energy Consumption in the Heating Sector, and 2025, 2035 and 2050 targets for consumption.** The graph below shows current energy consumption across all sectors and sets targets for future consumption in line with the goals of a greater than 1/3 reduction by 2050.

- **Number of homes energy audits completed.** Vermont has a goal of using more than 1/3 less energy by 2050. Home energy audits develop strategies for residents to use less energy. ### homes have been audited since 2010. (Source: VT Gas, Efficiency Vermont and Burlington Electric department)

- **Current energy Consumption in the Electric Sector, and 2025, 2035 and 2050 targets for consumption.** The graph below shows current energy consumption across all sectors and sets targets for future consumption in line with the goals of a greater than 1/3 reduction by 2050.

- **Number of home weatherization projects completed.** Vermont has a goal of weatherizing 25% of homes by 2020. ### homes, or ##%, have been weatherized since 2010, leading a ##% decrease in energy use. (Source: ???)
Percent of natural gas saved in 2010 from building weatherization and heating equipment upgrades.

Sources of total regional energy generation. The graph below shows how energy in the region is currently produced.

Targets for total regional energy generation sources in 2025, 2035 and 2050. The graph below shows the targets for the region to meet the goal of obtaining 90% of all energy in all sectors from renewable sources by 2050.

Current Solar Generation in Chittenden County and Solar Generation Goals Needed to Meet 2050 Goals. The table below shows solar generation and solar generation targets for the region and each municipality. See Map ## for more details.

Current Wind Generation in Chittenden County and Wind Generation Goals Needed to Meet 2050 Goals. The table below shows solar generation and solar generation targets for the region and each municipality. See Map ## for more details.
According to the Vermont Energy Atlas, in 2009, 0.06% of electricity consumed in Chittenden County is from privately owned renewable energy sources. Utility renewable energy generation is excluded because utility energy generated may not be used in Chittenden County.

result in a need much greater than 1,000 rental units by 2015. However, this must be balanced by a viable market—developers will build more units when most of the existing units are occupied.

23. Affordable Homes - An increase of 1,000 homeownership units in the County priced under $300,000 is needed by 2015 to increase housing choices and lower costs. This need could be met through existing permitted developments, however many are not being built due to challenges with condominium financing. For the same reason as mentioned above, the 1,000 units is based on a conservative vacancy rate figure.

24. Maintenance of Existing Housing – There is a need to adequately maintain existing housing stock to preserve it as a viable option for the future.

25. Supportive Housing - There is a need to increase the number of units of permanent supportive housing throughout the County in addition to Burlington. Supportive housing is a combination of housing and services intended as a cost-effective way to help people live more stable, productive lives. Supportive housing is widely believed to work well for those who face the most complex challenges—individuals and families who have very low incomes and/or disabilities, and/or may suffer from substance abuse, addiction or alcoholism, mental illness, HIV/AIDS, or other serious challenges to a successful life.

26. Mode Share - While our rate of driving alone to work increased by 36% between 1980 and 2000 (to 76% of all work trips), in more recent years this trend has shown improvement to 71% in 2010. We’ve also seen a nearly 60% increase in transit ridership the past decade. Vehicle Miles of Travel (VMT) per person is also on the decline, down 8% between 2000 and 2010. It is imperative that we maintain these positive recent trends in order to reduce congestion, decrease greenhouse gas emissions, and more efficiently utilize all of our transportation resources.

27. Road System & Funding - Roadway condition is rated poor or worse for over half of the arterial highway mileage in Chittenden County. The costs associated with maintaining and improving this infrastructure exceeds our fiscal capacity to fully address it. Nor do we have adequate funds needed to grow transit, walking/biking, and Transportation Demand Management (TDM) programs. Compounding our poor roadway conditions and inadequate investment, transportation funding in general is overly reliant on the state and federal gas taxes which are decreasing in value as inflation lowers purchasing power and revenues decline due to improving vehicle fuel efficiency and fewer VMT. The prospect of less funding in a time of increasing transportation investment need is a worrisome trend and needs to be addressed.

28. Meeting Vermont’s State Energy Goals – Vermont has set ambitious goals to reduce the state’s consumption of energy across all sectors (heating, electricity and transportation) by 15% by 2025, and by more than 1/3 by 2050 and to obtain 90% of energy from renewable sources by 2050. Meeting these goals will require a large increase in efficiency measures, the electrification of the transportation sector, and a significant increase in renewable energy production sited in Chittenden County. While CCRPC and municipalities are undertaking a planning effort to meet these goals, the goals cannot be met without the involvement of private-sector energy developers, working in cooperation with regional and state-wide utilities.

29. Energy Conservation – Vermont and Chittenden County lead the nation with respect to initiatives that support efficiency and renewable energy, however, more efficiency programs are needed.
for non-regulated thermal fuels and energy for transportation to keep costs down and to reduce GHG emissions.

30. Renewables Siting – With the rise of renewable energy sources, municipalities are struggling with being left out of the conversation and are making specific recommendations within their Town Plans regarding how they want the Public Service Board to review petitions in their Towns.

31.29. Water and Wastewater– In order for municipalities to implement their plans for future growth in their urban or village improved water and wastewater services (both on-site, community systems, and sewer) are often necessary, including financial assistance. Colchester, Essex Junction, Huntington, Hinesburg, Westford, and Williston were among the municipalities raising this concern.

32.30. Stormwater Investments – Municipalities are committed to making improvements in storm water quality, but are concerned about the costs and how to pay for them.

We are at a time of choice. Do we allow things to keep going the way they are? Do we take steps to achieve the best future possible?

See Chapter 3 for strategies and actions to address these concerns.
3.2.2 STRIVE FOR 80% OF NEW DEVELOPMENT IN AREAS PLANNED FOR GROWTH, WHICH AMOUNTS TO 15% OF OUR LAND AREA.

The areas planned for growth are defined as the Center, Metro, Suburban, Village, and Enterprise Planning Areas (all but Rural) as displayed on the Future Land Use Map. CCRPC is committed to annually monitoring the quantity and location of development to measure our progress on concentrating 80% of new growth in these Planning Areas at a regional scale (not each municipality). This goal mimics the development patterns we've seen in the recent past (see Section 2.5.1 Indicators for more detail). CCRPC will monitor this through annual updates of its housing, employment, and commercial/industrial square footage databases and also by the State of Vermont’s e911 locational database. The databases identify when a structure was built, number of dwelling units, employees, and square footage at a specific location. The major source of information for updating these databases will be gathered from CCRPC’s member municipalities. ENERGY SITES?

Increasing investment in denser, mixed use growth areas will improve economic opportunities, housing options, transportation options and improve community health. Focusing growth in the appropriate planning areas is also a cost-effective approach to increasing the supply of affordable housing, reducing energy consumption and using existing infrastructure efficiently. Finally, this pattern of growth reduces energy consumption for transportation.

Actions

1. **Invest in Areas Planned for Growth**
   - a. Establish wastewater, water infrastructure and public transit in areas currently developed and/or planned for growth.
   - b. Target reuse, rehabilitation, redevelopment, infill, and brownfield investments to the non-rural Planning Areas.
   - c. Retrofit existing buildings to reduce energy use and greenhouse gas emissions.
   - d. Improve design quality of high density areas, and allow flexibility for creative solutions.

2. **Municipal Planning and Zoning** - Strengthen and direct development toward areas planned for growth through infill development and adaptive reuse of existing buildings through municipal plan and bylaw revisions and state designation programs.
   - a. Municipal Development Review Regulations should be revised to improve the mix of uses, shared parking, support for transit, access to a variety of services (for example restaurants, grocery stores, parks, entertainment) via active transportation, energy efficiency, renewable energy and the affordability of housing. A particular emphasis is needed on providing for affordable rental housing.
     - **FUNDED VITAL PROJECT - South Burlington’s Pathway to Sustainability** – The overall project includes a series of initiatives to support, develop, and create a community that will be a leader in sustainable food production, housing, transportation, energy efficiency, natural resource protection, transit oriented development, residential quality of life and economic growth. Specifically, ECOS funding is supporting an overhaul of the City’s Land Development Regulations,
Vermont Legal Aid to test and enforce state protected classes (Age, marital status, sexual orientation, gender identity, receipt of public assistance).

4. Energy – Transform the Region’s energy system to meet the goals of Vermont’s energy and greenhouse gas reduction goals.

a. Reduce Energy Consumption – Education and outreach to key sectors regarding weatherization, life cycle fuel costs, and behavioral adjustments will be essential elements for reducing energy use and costs over time.

a. Reduce energy consumption and decrease greenhouse gas emissions, to support the State’s goals of reducing greenhouse gas emissions:

- Reduce greenhouse gas emissions 50% from 1990 levels by 2028,
- Reduce greenhouse gas emissions 75% from 1990 levels by 2050,
- Reduce per capita energy use across all sectors (electricity, transportation and heating) 15% by 2025,
- Reduce per capita energy use across all sectors (electricity, transportation and heating) by more than 1/3 by 2050, and
- Weatherize 25% of all homes by 2020.

i. Continue partnerships with Vermont Gas, Burlington Electric Department, Efficiency Vermont and the State Weatherization Assistance Program to facilitate the weatherization and increased energy efficiency of housing stock and other buildings.

Encourage individual homes and businesses to include electric and thermal energy efficiency in building and/or retrofitting. Weatherization should be promoted and executed as a first step to reduce overall energy consumption before investing in renewable energy systems. There is a need for focused study to determine solutions for vermiculite removal as it relates to weatherization, in particular low income weatherization. Vermiculite was used as an insulator for decades (1960-1990) and was mined with asbestos thus any home with vermiculite is assumed to be contaminated.

ii. Promote alternatives to fossil fuels for heating by working with partners such as Efficiency Vermont to educate developers and homeowners on the benefits of technology such as cold climate heat pumps, wood heating and geothermal systems, and by supporting alternative forms of heating. Examples of alternative forms of heating include district heating (for example, using waste heat from the McNeil Plant to heat buildings in Burlington) and biogas generation (capturing the methane produced by landfills or farms and using it instead of natural gas).

iii. Work with partners to promote stretch energy codes and assist municipalities wishing to adopt Stretch Energy Codes.

iv. Reduce fossil fuel consumption in the transportation sector, through the Transportation Demand Management and electric vehicle promotion strategies outlined in Part 6c of this section and in the Metropolitan Transportation Plan (MTP) included in this plan.

v. Increase resilience to potential interruptions of grid power, especially for maintaining essential services (including water supply and sewage disposal) without electrical power. Such services need, in the short term, backup power.
with at least a week's supply of stored fuel. In the long term, redesign these services in a more resilient way.

b. Increase Renewable Energy Generation, to support the State’s goal of 25% renewable energy by 2025 and 90% renewable energy by 2050.
   i. Renewable energy generation is strongly encouraged in areas identified as prime solar or wind generation areas, or on preferred sites. Determine appropriate sites for community-level renewable energy generation. Recent work on this topic has included the Legislature’s Solar Siting Task Force Committee in 2015; and three Regional Planning Commissions have received Department of Energy grants. CCRPC has not yet received these funds, but will benefit from the work of the other three RPC’s—and will hopefully be able to build on that work if CCRPC receives its own grant to work on this task further. Renewable energy generation shall not take place in areas with state or local known constraints. Renewable energy generation on areas with state or local possible constraints may require mitigation, and further investigation may deem the site unsuitable. See the discussion of Maps ## and ## for further details on known and possible constraints, and for a listing of preferred sites.

While it may not be feasible for energy generation facilities to be bound by this plan’s goal of 80% of new development in areas planned for growth, it is this Plan’s policy to highly encourage rooftop solar generation wherever possible, as this promotes distributed generation and lessens greenfield development.

   i. Use the Vermont Energy Action Network (VEAN) Energy Dashboard to educate residents and municipalities about opportunities to reduce energy use and switch to renewable energy sources. Encourage individual homes and businesses to include renewable energy options in building and/or retrofitting.

5. State/Local Permitting Coordination & Improvement

a. Support changes to the local and state permitting process to make the two more coordinated and effective. Participate in the Agency of Commerce and Community Development’s (ACCD) process to improve the State’s designation programs designed to encourage development in appropriately planned places and discourage development outside of those areas. This program could be improved with regulatory and/or fiscal incentives. These could include expedited permitting processes for projects in areas that are: a) designated for growth; and, b) where a community has a robust plan, regulations and staff capacity; and reduction of redundancies such as delegation of permitting for certain local and state reviews (such as exemption from Act 250). In conjunction with delegation it may be appropriate to develop more stringent standards and thresholds for development review in rural areas.

b. Collaborate with stakeholders to ensure local and state regulations, bylaws and plans encourage transparency, predictability and timely review of sustainable and environmentally sound development applications.

c. Develop a transportation assessment process that supports existing and planned land use densities and patterns in Center, Metro, Suburban, Village, and Enterprise Planning Areas to allow for more congestion and greater mode choice than allowed by current standards. The CCRPC will collaborate with the Vermont Agency of Transportation (VTrans), the Natural Resources Board, and other state and local stakeholders to
develop a process that evaluates the transportation impact from a multi-modal perspective rather than just a traffic flow standpoint.

- Policies and planning studies that are adopted as part of this ECOS Plan and subsequent amendments will guide CCRPC’s position in permit proceedings.

6. Metropolitan Transportation Plan Investments

a. Adequately fund the maintenance and preservation of our existing transportation assets including roads, bridges, rail, transit, walking/biking facilities, and transportation demand management (TDM) programs and facilities.

b. New transportation system investment should focus on the highest priority transportation projects as detailed in the ECOS/Metropolitan Transportation Plan (MTP) Project List. In the next five years, these projects will primarily be those that are included in the Transportation Improvement Program (TIP), as may be amended. The TIP projects are considered FUNDED VITAL PROJECTS for the purposes of the Comprehensive Economic Development Strategy (CEDS).

c. Future project investments and specific focal areas for targeted implementation impact include:

i. For transportation planning studies that have been adopted as part of this ECOS Plan, the specific recommendations for project, policy, and program investments will guide CCRPC investment priorities.

ii. Expand Intelligent Transportation Systems (ITS) for the roadway network, and traffic and transit operations, to improve safety and reduce congestion;

iii. Expand the Go! Chittenden County Transportation Demand Management (TDM) program (including park and ride facility development) to reduce single occupancy vehicle (SOV) trips

iv. Increase investment in CCTA transit services to increase user accessibility

v. Expand walking and biking infrastructure to support active transportation and to provide interconnection with the region’s transit system

vi. Develop a regional network of electric vehicle charging stations to accommodate the growth in low emissions, low energy costs electric vehicles and support the expanded adoption of natural gas vehicles for heavy duty fleets.

vi. vii. Implement the strategies identified in the Chittenden County Active Transportation Plan.
within the sewer service area. Future development and redevelopment in this Planning Area should be
publicly sewered, minimize adverse impacts on natural resources, and protect strategic open space.

_Enterprise Planning Areas_ are areas where local zoning authorizes a future concentration of
employment uses that attract workers from the County and multi-county region. Development in these
Planning Areas should have adequate wastewater capacity and access to transit or be near these
services. Typically, this area encompasses major employers or a cluster of single employers and has
current or planned transit service.

_Village Planning Areas_ are areas where local zoning authorizes a variety of future residential and
nonresidential development at densities and scales in keeping with the character of a Vermont village,
generally between 2 and 12 dwelling units per acre if sewered and between 0.2 and 4 units per acre if
not sewered. Village Planning Areas are compact areas of mixed-use activities that maintain the
character of a Vermont village. This type of Planning Area is intended to serve its local surroundings as
a place where people can live, work, shop and recreate.

_Rural Planning Areas_ are areas where regional and town plans promote the preservation of Vermont’s
traditional working landscape and natural area features. The Rural Planning Area also provides for low
density commercial, industrial, and residential development (generally 1 dwelling unit per acre or less)
that is compatible with working lands and natural areas so that these places may continue to highlight
the rural character and self-sustaining natural area systems. Development in the rural planning areas
is typically outside the sewer service area.

_Map 3 – Existing Utilities and Facilities_
The Utilities and Facilities Map shows the existing sewer service area, the water supply district, solid
waste facilities, natural gas service area, and cellular towers.

_Map 4 - Future Transportation Improvements_
The Future Transportation Improvements Map gives an overview of the projects that fit within the
funding constraints identified in the ECOS project list in Section 4.3.6 of the ECOS Plan. These future
improvement projects create a multimodal strategy to address the efficient and long term movement of
people and goods, while respecting ECOS goals. For a complete overview of proposed transit
investments refer to the [2010 CCTA Transit Development Plan](#).

_Possible New Map 5 – Solar Generation Potential_
This map combines GIS analysis of solar generation potential with _known and possible_ constraints. For
more information on the methodology used to determine solar generation potential, please visit
[http://www.vtenergyatlas-info.com/solar/methodology](http://www.vtenergyatlas-info.com/solar/methodology). This map and the corresponding data are
intended to be used to inform energy planning efforts by municipalities and regions. They may also be
used for conceptual planning or initial site identification by those interested in developing renewable
energy infrastructure. They should not take the place of site-specific investigation for a proposed facility
and should not be used as siting maps.

_Known_ constraints signal likely, though not absolute, unsuitability for development based on statewide
or local regulations or designated critical resources. _Possible_ constraints signal conditions that would
likely require mitigation, and which may prove a site unsuitable after site-specific study, based on
statewide or regional/local policies that are currently adopted or in effect. Areas with known constraints
are removed from the Solar Generation Potential map completely, leaving:
1. Prime Solar Areas: areas with generation potential and no constraints, and
2. Base Solar Areas: areas with generation potential and possible constraints.

As with all maps included in the ECOS Plan, the solar generation map is intended to provide a general overview of existing conditions. The accuracy of information presented in the maps is limited due to scale. Errors and omissions may exist, including in the analysis of whether a site has solar generation potential to begin with. These maps are not sufficient for delineation of features on-the-ground. To determine whether a site is appropriate for solar development, surveyed information or engineering studies will likely be necessary to determine whether known or possible constraints exist. Finally, the maps indicate land-based potential and existing development is not taken into account. Rooftop solar panels may be appropriate on existing structures in areas with known constraints.

Known Constraints
- FEMA Floodways
- DEC River Corridors
- National Wilderness Areas
- State-significant Natural Communities and Rare, Threatened, and Endangered Species
- Vernal Pools (confirmed and unconfirmed)
- Class 1 and 2 wetlands (VSWI and advisory layers)
- Local Known Constraints—see table below (table will be reformatted for ease of reading)

### Possible New Map 6 – Wind Generation Potential

This map combines GIS analysis of wind generation potential with *known* and *possible* constraints. For more information on the methodology used to determine wind generation potential, please visit [http://www.vtenergyatlas-info.com/wind/methodology](http://www.vtenergyatlas-info.com/wind/methodology). This map and the corresponding data are intended to be used to inform energy planning efforts by municipalities and regions. They may also be used for conceptual planning or initial site identification by those interested in developing renewable energy infrastructure. They should not take the place of site-specific investigation for a proposed facility and should not be used as siting maps.

**Known** constraints signal likely, though not absolute, unsuitability for development based on statewide or local regulations or designated critical resources. **Possible** constraints signal conditions that would likely require mitigation, and which may prove a site unsuitable after site-specific study, based on statewide or regional/local policies that are currently adopted or in effect. Areas with known constraints are removed from the Wind Generation Potential map completely, leaving:

3. **Prime Wind Areas**: areas with generation potential and no constraints, and
4. **Base Wind Areas**: areas with generation potential and possible constraints.

As with all maps included in the ECOS Plan, the wind generation map is intended to provide a general overview of existing conditions. The accuracy of information presented in the maps is limited due to scale. Errors and omissions may exist, including in the analysis of whether a site has wind generation potential to begin with. These maps are not sufficient for delineation of features on-the-ground. To determine whether a site is appropriate for wind development, surveyed information or engineering studies will likely be necessary to determine whether known or possible constraints exist. Finally, the maps indicate land-based potential and existing development is not taken into account.

**Known Constraints**
- **FEMA Floodways**
- DEC River Corridors
- National Wilderness Areas
- State-significant Natural Communities and Rare, Threatened, and Endangered Species
- Vernal Pools (confirmed and unconfirmed)
- Class 1 and 2 wetlands (VSWI and advisory layers)
- Local Known Constraints—see table below (table will be reformatted for ease of reading)

### Underhill

- Class 3 Wetlands
- Riparian Connectivity
- SEQ Natural Resource Protection Area
- Class 1 and 2 Wetland Buffers (50 ft)
Map 5 - Water Quality and Safety Map
The Water Quality and Safety Map illustrates the level of impairment for streams and lakes based on the Vermont Department of Environmental Conservation 303d List and the 2012 List of Priority Surface Waters. Additionally, it shows the location of wetlands, fluvial erosion hazard areas, special flood ways, and the 500 year flood hazard area.

Map 6 - Natural Systems Map
The Natural Systems Map depicts sensitive and protected areas in the County. Sensitive areas include ground water source protection zones, deer wintering areas, primary agricultural soils, habitat blocks, core forests, and rare, threatened or endangered natural communities. Sensitive areas are partially protected through the municipal permitting process and Act 250. The map also includes areas that are protected or where development is discouraged. For the purpose of this map, conserved lands, parks, rivers and their buffers, areas over 2,500 ft., special flood hazard Areas, and wetlands make up the protected category. Protection levels and development potential may vary depending upon jurisdiction.

Map 7 - Opportunity and Race Map
The Opportunity and Race Map combines an opportunity index, developed by the U.S. Department of Housing and Urban Development, with U.S. Census data on race. The purpose of this map is to show levels of opportunity in areas where there are the highest concentrations of racial minorities. HUD has developed a process for analyzing opportunity at the Census Tract level. The opportunity index includes data on poverty rate, school proficiency, homeownership rate, unemployment, and job access. Each tract is ranked relative to the others in the county. Tracts that are low opportunity typically have a higher proportion of rental housing, people receiving public assistance, lower school scores, and more unemployment in comparison to other areas. Opportunity mapping is a way to see where to target investments to address disparities in the County.

Map 8 - 2013 Metropolitan Transportation Systems Map
The Metropolitan Transportation Systems Map represents the present transportation network. The Metropolitan Transportation System is the multimodal network of highways, arterial and major collector roadways, transit services, rail lines, bicycle paths, sidewalks, Burlington International Airport, and other inter-modal facilities critical to the movement of people and goods in the region.

Map 9 - 2006-2010 High Crash Locations-Intersections
The High Crash Locations at Intersections Map depicts where the rate of crashes exceeds a threshold known as the critical rate. Locations are ranked by calculating a ratio between the critical rate and actual rate.

Map 10 - 2006-2010 Crash Locations-Segments
The High Crash Locations of Segments Map depicts where the rate of crashes exceeds a threshold known as the critical rate. Locations are ranked by calculating a ratio between the critical rate and actual rate.
Map 11 - Transportation Corridors
The Transportation Corridors Map represents the locations of the corridors where projects, programs, and strategies are implemented within Chittenden County's transportation system.

4.1.2 ACT 250, SECTION 248 & SUBSTANTIAL REGIONAL IMPACT

In accordance with 24 VSA § 4345a(17) a regional planning commission shall, as part of its regional plan, define a substantial regional impact, as the term may be used with respect to its region. This definition shall be given due consideration, where relevant, in state regulatory proceedings. Those proceedings are:

1. Act 250 – Certain proposed developments are required to obtain a permit from one of Vermont's nine District Environmental Commissions in order to establish that the proposed development will satisfy 10 criteria defined by Act 250 (10 VSA §6086). One of these 10 criteria is that the proposed development be “in conformance with any duly adopted local or regional plan or capital program.”

2. Section 248 – Certain proposed utility facilities are required to obtain a permit from Vermont's Public Service Board to establish that the proposed facility will satisfy criteria defined by Section 248 (30 VSA §248). One of the Section 248 criteria is that the proposed facility will “not unduly interfere with the orderly development of the region with due consideration having been given to the recommendations of the municipal and regional planning commissions.”

3. In addition, the Secretary of the Agency of Natural Resources may not issue a new Solid Waste Management Facility Certification (10 VSA §6605(c)) unless the facility is “in conformance with any municipal or regional plan adopted in accordance with 24 VSA Chapter 117.”

In accordance with 24 VSA §4348 (h), in the above three proceedings, in which the provisions of a regional plan or a municipal plan are relevant to the determination of any issue in those proceedings, the provisions of the regional plan shall be given effect to the extent that they are not in conflict with the provisions of a duly adopted municipal plan. To the extent that such a conflict exists, the regional plan shall be given effect if it is demonstrated that the project under consideration in the proceedings would have a “substantial regional impact.” That is, the issue of whether a proposed development has a “substantial regional impact” is important only when there is a conflict between the regional plan and municipal plan. CCRPC will attempt to reduce the potential for such conflicts through its municipal plan review and approval process.

The following is the required definition of “substantial regional impact,” as this term is to be used with respect to Chittenden County:

* A proposed development has a substantial regional impact if it is not consistent with the Future Land Use Plan, the Solar Generation Map or the Wind Generation Map of this Regional Plan.*

This definition puts the emphasis on the Planning Areas – and stipulates that if a development proposal is not consistent with the Planning Areas, then the Regional Plan will take effect in the State proceedings (as described above) if there is a conflict between the regional plan and the municipal plan. The Planning Areas form the basis for the appropriate areas for growth in the next 20 years as shown in the Future Land Use Plan.
As part of the MTP development, and especially as we look long term, we will be relying on our transportation model to evaluate different transportation futures and measure their impacts. Our first scenario, or base case, will be run first and will look at what happens as the region grows in future years with only our current transportation system and the additional projects identified in our 4-year TIP. The other three scenarios will include the base case, but will be built on very different and distinct strategies so that any differences can be better evaluated in helping to determine the MTP scenario. It is likely that the MTP scenario will incorporate elements from all the scenarios. The scenarios and their elements are identified in the table below.

<table>
<thead>
<tr>
<th>Scenarios Evaluated for Years 2015, 2030, &amp; 2050</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Base Build</strong></td>
</tr>
<tr>
<td>Existing transportation system plus all TIP projects</td>
</tr>
</tbody>
</table>

All scenarios will be evaluated to ensure that they are consistent with our projected long term fiscal constraints. Each scenario is also proposed to use the same level of growth in population, housing, and employment out to 2050.

In the MTP Scenario, we will look closely at the model results from the three scenarios and build a long range MTP project and strategy list that will likely pick aspects from each. This “hybrid” scenario will also be tested, and modified to become the proposed MTP long term recommendations in the fall. The MTP scenario will also loop back with the energy planning work to determine the impact this scenario has on advancing the State’s goal of 90% renewable energy by 2050.

**Issues for TAC Consideration and Feedback**
We are somewhat limited in the number of scenarios we can test and are looking for TAC guidance. Have we selected the right ones? What might be another and what elements would it include? Are there other components we should include in any of the scenarios we’ve proposed? Each transportation scenario is using the same land use (numbers of jobs and homes in the same places, given the recently approved 2050 Demographic Forecast, except the TDM/Energy scenario which includes a denser land use pattern.

**Evaluation Criteria**

In the last MTP we used the following measures to evaluate the scenarios:

1. Future congestion – volume to capacity ratios
2. Daily total vehicle miles of travel (internal/external)
3. Daily transit trips
4. PM peak hour vehicle hours of delay
5. Cost

Others to be considered:

6. Energy usage/greenhouse gas emissions
7. Other?

**Color Key:**
- **strikethrough**: Projects proposed for removal (as well as programs that are already removed) so we can instead focus on major infrastructure/utilities.
- Projects proposed for removal because they are on the MTP project list
- Questionable infrastructure projects - keep these or remove?
- Cost estimate or date from old CEDS list that needs to be updated
- New projects
